

A3 Trading Management

Trailer trading and manufacturing on ERPNext — buying, building, chassis control, stock, selling and accounts in one portal.

This document describes everything the system does: each screen, what it is for, the operations you can carry out on it, and the rules the system enforces. It is written so that someone who has never used the system can understand what it offers and how a trailer moves through it from the first purchase to after-sales warranty.

1 The system in one page

A3 buys material from suppliers, builds trailers from it, gives every trailer its own chassis number, holds finished trailers in stock, sells them to customers, delivers and invoices them, and keeps the warranty on record afterwards. A3 Trading Management runs that whole business on ERPNext, through a portal made for daily use.

The central idea: a trailer is an individual, not a quantity. The moment A3 decides to build one, it receives a chassis number, and that number follows it through the whole system: the plate in the fabrication bay, the stock list, the sales reservation, the delivery note, the invoice and the warranty record. A3 never sells "3 flatbeds"; it sells chassis **A3-26-000296**.

production stages per
trailer

1

set of books: the standard
ERPNext ledger

Main capabilities

- **Buying:** requisitions, purchase orders, goods receipt, supplier bills with an approval hold, supplier payments.
- **Supplier compliance:** licence, VAT and establishment expiry tracking; orders to lapsed suppliers are refused.
- **Manufacturing:** work orders with a material check, build to stock or to a customer order, six tracked production stages and a printed traveler.
- **Chassis and serial control:** chassis numbers issued automatically from a configurable format, frozen once issued, never reused.
- **Selling:** sales orders that reserve a specific chassis, build-to-order, dispatch and invoicing that carry the chassis number.
- **Accounts:** customer receipts, supplier payments, journal entries, receivables and payables — all on the standard ledger.
- **Live Stock:** stock value, stock by warehouse, low-stock alerts with one-click requisitions, trailers listed by chassis.
- **Dashboard:** trailers in stock and in production, deliveries, revenue and money owed each way.

No separate books

Every portal screen is a view onto standard ERPNext documents. Approving a purchase invoice in the portal submits the real Purchase Invoice; posting a journal submits the real Journal Entry. The figures on the portal are the same figures the accountant sees in ERPNext's own reports.

Draft first, then approved

Almost every document has two states. Saved, it is a **draft**: it can still be changed or deleted and has no effect on stock or money. Approved (ERPNext calls this **Submit**), it is **posted**: stock moves, money is owed, and it can no longer be edited. A posted document is undone by cancelling it and, if needed, amending a copy. Nothing counts until a person approves it.

2 How a trailer moves through the system

The whole business is one chain. Each link is a screen in the portal, and each hands its result to the next.

Buy Material is requisitioned, ordered, received and billed	Build A work order issues the chassis numbers	Stages The trailer moves through six production stages	Stock The finished trailer enters the Finished Goods yard	Sell A sales order reserves a specific chassis	Deliver Delivery note and invoice carry the chassis	Warranty Start and expiry held on the same number
---	---	--	---	--	---	---

The full cycle, step by step

#	Step	Screen	What happens
1	Request material	Requisitions	A requisition lists the items and quantities needed and the yard they go to. It is approved, rejected, or turned into a purchase order.
2	Order it	Purchase Orders	The order is checked (prices, supplier compliance) and approved. It now waits to be received and billed.
3	Receive it	Goods Receipt	A receipt is drafted with the ordered quantities, corrected if less arrived, and submitted. The stock is now in the Stores yard.
4	Get the bill	Purchase Invoices	The supplier's bill is raised from the receipt. It can be put on hold with a reason, released, then approved into the ledger.
5	Pay the supplier	Supplier Payments	A full or part payment is drafted against the bill and submitted when the money goes.
6	Raise the work order	Manufacturing	The system checks material availability, then issues one chassis number and one trailer record per unit, reserved to the work order.
7	Emboss the plates	Chassis Plates	An embossing sheet is printed for the fabrication bay; once struck, the plates are marked embossed.
8	Build through six stages	Manufacturing	The work order moves Material → Fabrication → Assembly → Paint → QC → Delivery. The last move completes it and posts the trailers into Finished Goods.
9	Take the customer's order	Sales Orders	A sales order is created and confirmed.
10	Reserve or build a trailer	Sales Orders	A specific in-stock chassis is reserved to the order, or a new work order is raised for it (build to order).
11	Dispatch it	Delivery & Invoice	A delivery note carrying the chassis is created and submitted when the trailer leaves the yard. The customer becomes its owner.

12	Invoice it	Delivery & Invoice	The sales invoice is made from the delivery note and carries the chassis number.
13	Receive payment	Payments & Receipts	A full or part receipt is recorded against the invoice.
14	Warranty	Serial Register	Warranty start and expiry dates are held on the trailer's record for life.

This same chain is automated as an end-to-end test that posts every document in order and fails loudly if any link breaks.

3 The portal and how you work in it

The portal is the daily workspace. It opens at the site's home address after login and has a fixed left-hand menu of eight entries. Buying, selling and accounts screens are grouped under one entry, **Transactions**.

Menu entry	What it is for	Typical user
Home	The business at a glance: trailers in stock and in production, deliveries and revenue, money owed each way, open work orders, recent deliveries, low stock.	Everyone
Customers	Customer list with orders placed and total spent; add and edit customers.	Sales
Manufacturing	Work orders from creation to "Delivered — added to stock": material check, six stages, notes, stage history, costing, traveler print.	Production supervisor
Serial Register	Every chassis number ever issued, searchable and filterable, with stage, status, owner, plate and warranty.	Everyone
Chassis Plates	The embossing sheet for the fabrication bay; records the embossing step.	Fabrication
Suppliers	Supplier list with compliance position (Clear, Expiring, Blocked) and paper expiry dates.	Purchasing
Transactions	The nine buying, selling and accounts screens, grouped on one page.	Purchasing, accounts, sales
Live Stock	Stock value, items in stock, low-stock alerts, open requisitions, payments missing, stock by yard, trailers by chassis.	Stores, manager

Screens under Transactions

BUYING

- Purchase Requisitions
- Purchase Orders
- Goods Receipt
- Purchase Invoices
- Supplier Payments

SELLING AND ACCOUNTS

- Sales Orders
- Delivery & Invoice
- Payments & Receipts
- Journal Entries

Common features of every portal screen

- **Summary figures at the top** — live totals for that screen (how many are waiting, how much is outstanding) so you see where you stand before scrolling.
- **Search and filters** on every list, and a count of the records shown.
- **Action buttons on each row** that move a document to its next step (Approve, Receive, Bill, Pay, Reserve, Dispatch, Invoice...). Each asks for confirmation before it posts anything.
- **New / Open** opens the full standard ERPNext form in a new tab, where every field is available. Save, close the tab, and the document appears on the portal list.
- **Clear refusals** — when a rule stops an action, the screen says why and what to do (see section 14).
- **Role selection** — a user with more than one role can choose how they want to use the system.

- **Old links are redirected** — addresses of screens from the earlier workshop product land on the portal home instead of failing.

4 Home dashboard

The first screen after login. It answers "where does the business stand today?" without opening anything.

Headline figures

Tile	Shows
Trailers in Stock	Finished trailers that are free to sell.
In Production	Trailers on the floor at any of the six stages.
Delivered	Trailer deliveries this month.
Revenue	Invoiced revenue this month.
Owed to Us	Customer receivables outstanding.
Owed by Us	Supplier payables outstanding.

Panels

- **Production Board / Trailers on the Floor** — how many trailers are at each stage.
- **Open work orders** — work order, trailer, stage and progress, with a link to Manufacturing.
- **Recent Deliveries** — date, customer, trailer and chassis of the latest dispatches.
- **Low Stock** — items at or below their reorder level, with what is available, linked to Live Stock.

5 Buying

From a request for material to paying the supplier. Five screens, each handing its document to the next.

Purchase Requisitions

Transactions › Requisitions › creates [MAT-MR-...](#)

A request for material ("we need 20 sheets of steel"), not yet an order.

Operation	What it does
New Requisition	Items, quantities and the destination yard (usually Stores).
Approve	Marks the requisition approved.
Reject	Removes it, with a reason recorded.
To Order	Asks which supplier and converts the requisition into a draft purchase order.

Summary: Requisitions › Awaiting Approval › Approved. Requisitions can also be raised from Live Stock's low-stock alerts and from a work order's material shortfall.

Purchase Orders

Transactions › Purchase Orders › creates [PUR-ORD-...](#)

Operation	What it does
New Order	Starts an order from scratch (or one arrives from a requisition's To Order).
Open / edit rates	Check and correct prices. An order from a requisition takes the item's buying price; if none exists the rate is typed in.
Approve	Submits the order; status becomes <i>To Receive and Bill</i> and a Receive button appears.
Cancel	Cancels an approved order.

Rule: an order to a supplier whose papers have lapsed or whose status is not compliant is refused, with the reason. The check runs wherever an order is made, including the standard form and imports.

Summary: Order Value of approved orders.

Goods Receipt

Transactions › Goods Receipt › creates **MAT-PRE-...**

Operation	What it does
Receive	On an order under <i>Awaiting Receipt</i> , drafts a receipt with the ordered quantities.
Edit quantities	Correct for short delivery or rejected items.
Submit	Posts the stock into the yard. The receipt gains a Bill button.

Purchase Invoices — with an approval hold

Transactions › Purchase Invoices › creates **ACC-PINV-...**

Operation	What it does
Bill	Raises a draft purchase invoice from a goods receipt.
Hold	Parks the draft with a typed reason; the row shows On Hold .
Release	Clears the hold.
Approve	Posts the bill to the ledger. Refused while on hold.
Pay	Shows the outstanding amount and drafts a full or part payment.

Why the hold matters: ERPNext's own hold can only be set after a bill has already posted. A3's "Held for Approval" gate keeps a questionable bill out of the books entirely until someone releases it.

Supplier Payments

Transactions › Supplier Payments › creates **ACC-PAY-...**

- Lists payments drafted from bills; **Submit** once the money has gone.
- Shows **Owed to Suppliers** and each supplier's balance **aged** by how long each bill has been waiting.
- A paid bill reads **Paid** . A bill that totals zero (order had no prices) cannot be paid and says so.

6 Suppliers and compliance

A3 may only buy from suppliers whose papers are in date. The system tracks them and enforces it.

Suppliers screen

Menu › Suppliers

- Supplier list with contact details, balances and compliance position.
- Add and edit suppliers, including their compliance papers.
- Each supplier shows one of three positions: **Clear** papers in date, orders allowed • **Expiring** a paper lapses within 30 days • **Blocked** orders refused.

COMPLIANCE DATA HELD ON EACH SUPPLIER

- Trade licence expiry date
- VAT certificate expiry date and whether VAT input is eligible
- Establishment card expiry date
- Compliance status, compliance score and country
- Whether non-compliance blocks purchase orders

Enforcement: every purchase order is checked when it is saved. If any paper has lapsed, or the status is not compliant, the order is refused with the exact reason, e.g. *"Purchase Order cannot be raised for <supplier>: lapsed: trade licence ..."*.

7 Manufacturing

Where trailers are built. A work order is the instruction to build a number of trailers of one model, either to stock or for a named customer order. Raising it is also the moment chassis numbers are issued.

Creating a work order

Manufacturing › New › creates **MFG-WO-...**

Field / feature	Function
Item to be manufactured	Search for the trailer model; only items with an active bill of materials (BOM) are offered.
BOM	The parts list and operations; the default BOM is chosen automatically.
Quantity & dates	Number of trailers, planned start and target delivery.
Take raw material from	The yard material is drawn from (usually Stores).
Finished trailers go to	The yard finished units enter (usually Finished Goods).
For sales order	Pick a customer's open order to build to order, or leave as <i>Build to stock</i> .
Specification	Notes for the floor — colour, axles, options. Printed on the traveler.

Material check and shortfall request

As soon as the BOM and quantity are set, the form lists every raw material with what is **needed**, what the yard **holds**, and any **shortfall**. Green means everything is there. The order can still be created when something is short, and **Request the shortfall** raises a requisition for exactly the missing quantities — so the shortage is found at the start, not at the last stage.

Six production stages

- Open a work order to see its current stage and a progress percentage.
- **Move to Fabrication / Assembly / Paint / QC** advances one stage, with an optional transition note.
- **Deliver & Add to Stock** is the last move: it completes the work order *and* posts the Manufacture stock entry that puts the finished trailers into Finished Goods. The card then reads "Delivered — added to stock".
- **Stage History** records every move with time, person and note.
- Each trailer's record mirrors its work order's stage automatically.
- Only the final stage puts anything into stock; a trailer at QC is still In Production and cannot be sold.

Production detail and costing

- Raw material lines with rate and amount.
- Operations with workstation, minutes and hourly rate.
- Operating cost, total production cost and cost per unit.
- Work-in-progress value across open orders.

Work order traveler (print)

- The printed sheet the floor works from.
- Work order, quantity, planned start, target delivery, sales order, yards.
- Specification, raw materials, operations.
- Stage table with "Done By / Sign" boxes, stage history, and sign-off for production supervisor, quality check and store / dispatch.

Build to order

When a work order is linked to a sales order — chosen on the form, or raised with **Build** from the Sales Orders screen — its finished trailers are **reserved to that order automatically** when they reach stock (never more than the order's quantity). Nobody has to come back and reserve them.

8 Chassis numbers and serial control

Each physical trailer has one **Trailer Serial** record carrying its chassis number for life.

Chassis Numbering Rule

Standard form › Chassis Numbering Rule (one setting for the company)

Setting	Meaning
Prefix	Leading letters, e.g. A3 .
Include year / year format	Whether the year appears, as 26 or 2026 .
Separator	Character between parts, e.g. - .
Sequence length / next number	Digits in the running number and the number to start from.
Check digit	None, Mod 10 (Luhn) or Mod 11.
Next chassis number	A live preview of the next number, e.g. A3-26-000297 .
Format Confirmed	Must be ticked before any chassis number is issued.

The number is embossed into steel and cannot be taken back, so the system never guesses a format: until the format is confirmed, trailer work orders are refused.

Automatic issue

- A work order for N trailers issues N chassis numbers and N trailer records **at the moment it is created**, reserved to that work order — whether raised from the portal, the standard form or an import.
- Only items ticked **Is a Trailer** receive chassis numbers; parts and raw material get ordinary work orders.
- Once issued, the chassis number is **frozen** — nobody can edit it.
- Cancelling a work order marks its trailers **Scrapped** but keeps the numbers on record; they are **never reissued**, so no two trailers can share a number.

What each trailer record holds

- Serial number and chassis number
- Trailer type (model)
- Status and production stage
- Originating work order
- Current warehouse and company
- Sales order it is reserved for
- Current owner (customer) and name
- Warranty start and expiry
- Embossed flag, embossed on, embossed by

Serial Register

Menu › Serial Register

- Every chassis A3 has ever issued.
- Search by chassis, serial, model, work order, yard or owner.
- Filter by stage and status.
- Shows plate (Pending / Embossed) and warranty position.
- Summary counts, including Awaiting Embossing.

Chassis Plates

Menu › Chassis Plates

- Lists trailers awaiting embossing, or one work order's batch.
- **Print sheet** for the fabrication bay.
- **Mark embossed** on the ticked trailers records who did it and when; Plate turns from Pending to Embossed.

Chassis number on selling documents

Sales orders, delivery notes and sales invoices carry the trailer serial and chassis number on each line, and the chassis prints on the delivery note and invoice.

9 Selling and delivery

Sales Orders

Transactions › Sales Orders › creates [SAL-ORD-...](#)

Operation	What it does
New Order	Customer, trailer model, quantity and price.
Confirm	Submits the order.
Reserve	Lists the chassis numbers in stock and reserves the chosen one to this order. Its status becomes <i>Sold</i> and it leaves free stock, so two salespeople cannot promise the same unit.
Build	When nothing suitable is in stock, raises a work order for this order (model and quantity). New chassis numbers are issued immediately and reserved to the order when finished.

Summary: Trailers in Stock (free to sell). Each row shows its reserved trailers and delivery progress. A sales order print format is included.

Delivery & Invoice

Transactions › Delivery & Invoice › creates **MAT-DN-...** and **ACC-SINV-...**

Operation	What it does
Dispatch	For confirmed orders under <i>Awaiting Dispatch</i> , drafts a delivery note naming every reserved chassis.
Submit (delivery)	When the trailer leaves the yard: its status becomes <i>Delivered</i> , the customer becomes its owner, and it leaves stock.
Print	The delivery note, with the chassis on it.
Invoice	Drafts a sales invoice from the delivery note, carrying the chassis number.
Submit (invoice)	Posts the invoice; it shows due date, outstanding amount and a Receive button.
Receive	Records a full or part customer payment against the invoice.
Delete	Deletes a draft invoice after a double confirmation. Shown only to roles allowed to delete; a submitted invoice must be cancelled first.

After the sale: warranty

Each trailer's record carries Warranty Start and Warranty Expiry dates and the current owner. The Serial Register shows every trailer's warranty position at a glance, years after the sale.

10 Money and accounts

All money screens work on the standard ERPNext ledger and chart of accounts. The portal keeps no books of its own.

Payments & Receipts

Transactions › Payments & Receipts

- **Owed to Us** (customer receivables) and **Owed by Us** (supplier payables) at the top.
- Every payment in or out, listed against the invoice or bill it settled.
- **Submit** a drafted receipt once the money is in the bank; the invoice's outstanding falls and it reads **Paid**.

Journal Entries

Transactions › Journal Entries › creates [ACC-JV-...](#)

- For anything that is not a bill, invoice or payment: accruals, corrections, opening balances.
- **New Journal** with account lines (account search built in); saved journals wait under *Awaiting Approval*.
- **Post** submits the journal to the ledger.
- A journal that does not balance, or has no lines, is refused with the difference shown.

Where the money stands

Screen	Money view
Home	Revenue this month, Owed to Us, Owed by Us.
Payments & Receipts	Receivables and payables, every payment in and out.
Supplier Payments	Owed to Suppliers, aged balance per supplier.
Purchase Invoices	Outstanding on approved bills.
Live Stock	Stock value; Payments Missing (received material not yet billed or paid).
Customers	Total spent per customer.

11 Live Stock

The stock position of the whole business, in quantities and in money, with trailers shown as individual chassis numbers.

Summary figures

Stock Value · Items In Stock · Low Stock Alerts · Open Requisitions · Payments Missing.

Views

View	Shows
Item totals	Total quantity per item with the warehouses it is held in (location), valuation and value.
Stock by Warehouse	Position per yard: in stock, reserved, ordered, requisitioned, projected, reorder level, low / out.
Trailers	Finished trailers listed as identified chassis numbers, not as a quantity.
Stocked (Stock In) / Stock Out	Recent stock movements with voucher, type and date.
Incoming (Ordered)	Material on order but not yet received.
Low Stock Alerts	Items at or below reorder level, or out of stock.
Material Requests	Open requisitions and their status.
Payments Missing	Purchase receipts not yet billed, and bills not yet paid, with amounts.

Filters by warehouse and status. **Request Selected** raises a requisition for the ticked low-stock alerts in one step.

12 Customers

Customers screen

Menu › Customers

- Customer cards with mobile, email, number of orders and total spent.
- **Add Customer** (name, mobile, email, TRN / VAT number) and edit in place; **Open** goes to the full record.
- Search and filters across loaded customers.

CUSTOMER RELATIONSHIP FIELDS

VIP flag, birthday, credit limit amount, credit hold, blacklist with reason, and lifetime value.

13 Background functions

Things the system does on its own, without a button.

Function	What it does
Chassis issue on work orders	Creates the chassis numbers and trailer records when any work order for a trailer model is created, however it was created.
Stage synchronisation	Keeps each trailer's stage and status in step with its work order.
Stock entry on completion	The final stage posts the Manufacture stock entry; the trailers become <i>In Stock</i> in Finished Goods and, for build-to-order, are reserved to the sales order.
Scrap on cancellation	Cancelling a work order marks its trailers Scrapped and retires their numbers.
Delivery hand-over	Submitting a delivery note marks its trailers Delivered and sets the customer as owner.
Supplier compliance check	Validates every purchase order against the supplier's papers.
Item numbering	New items are numbered from a series (e.g. RIG00001) while Item Code stays typeable: accept the suggested code or type your own. Two people creating items at once never collide.
Error capture	Errors in the browser or in server calls are logged automatically with page, user, browser and stack trace; repeats of the same error are grouped and counted. Each log has a status (Open, Investigating, Resolved, Ignored) and resolution notes.
Employee signatures	A drawn signature can be stored on an employee's record for use on printed documents.

14 Built-in rules and safeguards

These refusals are deliberate. Each protects something that would be expensive to get wrong.

When you see	It means	What to do
Chassis Numbering Rule not confirmed	Nobody has confirmed the chassis format, so no number will be issued.	Set the format and tick Format Confirmed.
Supplier not compliant	Trade licence, VAT certificate or establishment card has lapsed, or status is not compliant.	Update the supplier's papers and status.
... is on hold. Release the hold before approving it.	The purchase invoice was parked with a reason.	Resolve it, Release, then Approve.
... has nothing outstanding to pay	The bill totals zero, usually because the order had no prices.	Put prices on the order before billing.
Trailer ... is In Production, so it cannot be reserved	Only finished trailers in stock can be sold.	Wait for Deliver & Add to Stock, or Build.
No active BOM for ...	The model has no parts list, so it cannot be built.	Create and activate the BOM.

Work order is already at the final stage	The trailers are already in stock.	Nothing to do.
... is submitted and sits in the ledger. Cancel it first	A posted invoice cannot simply be deleted.	Cancel it in the standard form first.
Journal does not balance	Debits and credits differ.	Correct the lines so both sides are equal.

Other protections

- Chassis numbers cannot be typed or edited, and are never reused.
- A reserved trailer disappears from free stock at once.
- Every posting action asks for confirmation first; deleting an invoice asks twice.
- Nothing affects stock or money until it is approved.

15 Statuses and document numbers

Trailer status

In Production	Number issued; on the floor at one of the six stages.
In Stock	Finished, in Finished Goods, free to reserve.
Sold	Reserved against a customer's order.
Delivered	Delivery note submitted; the customer owns it.
Scrapped	Its work order was cancelled; number retired.

Document status

Draft	Saved, changeable, not yet counting.
Approved / Submitted	Posted and final (with sub-statuses such as To Receive and Bill, Unpaid, Paid).
On Hold	Purchase invoice parked before the books.
Cancelled	Undone; an amended copy can be made.

Supplier position

Clear	Papers in date; orders allowed.
Expiring	A paper lapses within 30 days.
Blocked	Orders refused.

Document numbers

Looks like	It is a
MAT-MR-2026-00022	Requisition
PUR-ORD-2026-00022	Purchase order
MAT-PRE-2026-00021	Goods receipt
ACC-PINV-2026-00018	Purchase invoice
ACC-PAY-2026-00013	Payment in or out
MFG-WO-2026-00014	Work order
A3-26-000296	Chassis number
SAL-ORD-2026-00011	Sales order
MAT-DN-2026-00008	Delivery note
ACC-SINV-2026-00006	Sales invoice

Chassis numbers follow whatever format A3 confirms in the Chassis Numbering Rule; the one above is an example.

16 Who does what

Which person may press which button is controlled by their role, assigned by the administrator. The system adds two roles of its own, **A3 Trading Admin** and **Workshop Manager**, alongside ERPNext's standard roles. A typical split:

Person	Screens they use	What they approve
Owner / general manager	Home, Transactions, Live Stock, Serial Register	Purchase invoices (release and approve), journal entries, sales invoice deletion
Purchase clerk	Requisitions, Purchase Orders, Suppliers	Raises orders; keeps supplier papers up to date

Stores	Goods Receipt, Live Stock	Receives material; raises requisitions when stock is low
Accounts	Purchase Invoices, Supplier Payments, Payments & Receipts, Journal Entries	Bills, payments in and out, journals
Production supervisor	Manufacturing, Chassis Plates, Serial Register	Raises work orders, moves trailers through stages, records embossing
Sales	Customers, Sales Orders, Delivery & Invoice	Customer orders, reservations, dispatch, invoicing

17 Setup before first use

The first three are deliberate locks: the system refuses to guess them.

#	Item	Why
1	Confirm the chassis number format	No trailer work order is accepted until Format Confirmed is ticked on the Chassis Numbering Rule.
2	Tick "Is a Trailer" on trailer models	Only these items receive chassis numbers.
3	Load supplier paper expiry dates	Orders to suppliers with lapsed papers are refused.
4	An active BOM for each trailer model	A work order needs a parts list.
5	Prices, warehouses and masters	Buying and selling prices on items (a zero-priced bill cannot be paid); the Stores, Work In Progress and Finished Goods yards; company, fiscal year, price lists, units and item groups reviewed against how A3 works.

18 Scope: what is not included

- **Workshop service:** repairs and servicing of sold trailers, job cards, estimates, appointments, telecalling, complaints and inspections are outside this system. It covers trading and manufacturing only.
- **Vehicle and driver records** of the earlier workshop product are not part of this system.
- Loading of historical data.
- New third-party integrations.
- A native mobile app (the portal works in a browser).
- Payroll and HR.
